Intentions

Event list

Aa Name	# Reward targetting	# Engagement depth	# New gameplay	# Power challenge	# Accessible challenge
[3.2] Time limited worlds	5	4	2	5	2

A. As a player,

1. I want to be able to engage more to get more rewards

2. I want to be able to target specific reward I need

B. As a game maker,

1. We want to challenge players on their collection variety

2. We want to challenge players on their team power

Feature

Engagement expectations

The time-limited world feature offers players a new area of engagement that we expect players to use depending of their investment in the game and their needs for the reward. The following table describe how we expect different categories of players to use these events from an intention standpoint.

▼ Expected engagement per player engagement type

Engagement behavior	Base daily playtime	Expected daily time in event	Example of expected progression	Expected main monetization driver
Light	30	5	First reward of the gauge or first world rewards if multiple worlds	Treasure opportunity in the event
Regular	60	20	Good medium of the gauge or few worlds rewards if multiple worlds	Treasure opportunity in the event + daily deals + small opportunistic

				offer (potion, shards, coins)
Invested	100	60	Final gauge reward or final world reward if multiple worlds	Medium price offer (potion, pet upgrades, event gating currency)
Elite	180	120	Final leaderboard reward	Big price offer (potion, pet upgrade, event gating currency)

Time limited world events

Ao Name	🕒 Day of the week	# Duration (h)	# Nb of level	⋮ Challenge type	🕒 Difficulty	⋮ Modifier / restriction	⋮ Reward type	🏆 Leaderboard
<u>Island Trial</u>	Monday 24	1	Power	Medium	Pet rarity boost	Biome egg	☐	
<u>Island Trial</u>	Wednesday 24	1	Power	Medium	Pet rarity boost	Biome egg	☐	
<u>Island Odyssey</u>	Friday 72	5	Collection Power	High	Biome restriction Specific pet boost New pets	Biome egg Candies	☒	

For this version, we are going to make those events:

Biome	Island Trials	Island Odysseys
Meadow	1 World	5 Worlds
Sea	1 World	5 Worlds
Savana	1 World	5 Worlds
Forest	1 World	5 Worlds
Jungle	1 World	5 Worlds

UI/UX

Pre-prod flow: <https://www.figma.com/design/42Gg64c6wP2rk8Hs9XZ6pP/v3.2?node-id=4007-2&t=zKXSzpwvmrv5LEQu-1>

Remote settings

WorldEvent should have new fields to handle the dynamic difficulty of time limited world events

- **DynamicPower:** true or false depending if this world uses a dynamic power. Dynamic power makes it so the world_power is based on the player current maximum power
 - Maximum power is computed as the player bonus power + the sum of all pets potential max power (if all upgrades are made) for the highest level pets of the player
 - If a world has DynamicPower to true, the world_recommended_power is computed as bonuspower + teampower + (world additionalPower *6)
 - The DynamicPower is computed once at event start (when the event is playable for the first time)
- **AdditionalPower:** the power to add or remove on top of the world_power
- **DynamicWorldCoinMultiplier:** true or false. If true the world uses the current MainWorld coin multiplier. If false it uses the world_coins_multiplier (set at event start and doesn't update with player progress in MainWorld)
 - In case of DynamicWorldCoinMultiplier = true the world_coins_multiplier field is the offset to add or remove to the DynamicWorldCoinMultiplier (e.g. DynamicWorldCoinMultiplier = true and the player current world has 8 as WorldCoinMultiplier, if world_coins_multiplier = 1 then the event has 9 as world_coins_multiplier)
- **DynamicWorldProgressCurrencyMultiplier:** true or false. If true the world uses the current MainWorld progress currency multiplier. If false, it uses the world_progress_currency_multiplier
 - Similar to DynamicWorldCoinMultiplier in terms of offset if true

We'll need to be able to define RandomSpawners in WorldConfig

- RandomSpawners to rename WorldRandomSpawners
- RandomSpawnersCycle to rename WorldRandomSpawnersConfig
- WorldRandomSpawnersConfig should have a new field "id" that is the id of this WorldRandomSpawnerCycle definition

- WorldConfig should have a new field WorldRandomSpawnersConfig that allows to set the random spawner config per world

A new tab eventContentList should allow to list all event content

- id: id of the eventContentList
- Content.id: today either WorldEvent or Leaderboard
- ProgressionOrder: int used to order the different levels for WorldEvent

Example:

ID	ContentId	ProgressionOrder
TLE_savanna_1	world_event_savanna_1	1
TLE_savanna_1	world_event_savanna_2	2
TLE_savanna_1	leaderboard_world_event	0

We need to make sure events cycle properly inside the same group

- For events with the same &grouping.group with similar &schedule.loopStartTimestamp the events are picked by &grouping.priority for available events (events that finished their &schedule.timeToRevive)

We should introduce a WorldRulesConfig to define the cost of the rebloom

- WorldConfig have a new column for WorldRuleConfig
- WorldRuleConfig is a new tab with
 - Id
 - Type: in 3.2 we only have "rebloom"
 - Value: the value can be used to set a variable of the type, for "rebloom" it is the cost to rebloom in HC

Rebloom world resource logic

If a world has the rebloom mechanic it means it doesn't respawn its resources. To handle this properly for players we want the following logic:

- When generated, resources of a world should be displayed at the same place and of the same type (for each generation)
 - If possible we can also keep the resource progress but it's a nice to have (e.g. I eat 50% of the resource as a player, I move and come back and I still see it at 50%)

- Each time the resources are re-spawned through the rebloom (which is the only way to respawn resources) it should be a new random generation
 - This means if players rebloom with resources on their tile these resources are deleted to let the new respawned resource spawn
- RandomSpawners (wheel, gift...) cycle should be reset when the rebloom happens
 - Previous RandomSpawners spawned should be kept on the map

New requirements

In 3.0.0 we introduced a requirement "tournament_inprogress" used to make stuff available when a Tournament is running. The main use case is to distribute the tournament currency only when the Tournament is live.

In 3.2, we should make this more generic and add more requirements to be able to have a wider range of behavior:

- tournament_inprogress becomes event_in-progress to make the naming more generic and ensure it works for all events
 - We could also make it so the event_id is put in "key" and not in "value" to be more consistent with the following requirements
- event_ended: this requirement will be used to trigger elements after an event ended
 - key: event_id

Additional unrelated requirement for 3.2:

- minion_biome_own with key being the biome name to check if the player has at least one pet of this biome

Balancing

 [3.2] - Time limited worlds balancing Intentions.

- ▼ Arthur's suggestion for balancing

We will probably need a "Time limited world intention" tab in order to balance correctly the events. We'll need tools to manage:

- The difficulty:
 - We should be able to compute how long it takes to complete each world depending on its power (same thing for the leaderboard)
 - This should be broken down per player engagement in other features to low, medium, high and high-payer
 - This should allow us to set the expected difficulty for each event (e.g. low engaged players are able to collect the mid reward of the Island expedition)
 - It should be clear what type of player is able to collect what reward
- The rewards:
 - We should be able to scale reward value according to the difficulty
 - To do so I recommend to set a value of reward per "effort". Effort should be defined from the length of completing an event (the amount of currency to collect) and the difficulty (the world power). Those two are of course related but we can play on those to generate different type of difficulty
